

Network Device Policy

Network devices (router, switch, hub, etc.) are NOT permitted on the University's network at any time unless it is owned by the University and has been put in place by Information Technology, or specifically has been approved by Information Technology. (The policy is published in our [Information Technology Policies and Legal Requirements](#) webpage) These devices can serve as gateways to our university's internal systems and can result in data theft, as well as other malicious activity. Additionally, they can cause conflict with our network protocols and potentially bring down the entire network.

Devices (PC, Mac, etc.) that are not owned and managed by the University **CANNOT** be connected to our *wired network* in the administrative offices at any time. However, these devices can be connected to University's public *wireless network*.
